Adobe Photoshop CS2 has two work areas: Expert mode and Standard mode. Expert mode is designed for expert users who want to use Photoshop's most powerful tools. The Standard mode also has many advanced features, but you can learn much of its power by using the Expert mode. Photoshop is a large, powerful program, one that's generally considered by its users to be a bit difficult to use, at least at first. But don't let that stop you. The only way to really get a good grip on Photoshop and master its versatility is to work on a lot of images in a very short time span, and if you keep at it, you'll get there. When first starting out with Photoshop, you'll notice that the interface isn't the easiest to use, especially when you first start changing shapes and tones. The range of tools can be intimidating, as you'll see in the upcoming sections. However, as you study the chapters in this book, you'll find that the processes within are simple, to the point, and involve many steps that are easy to perform. For each subject in the chapters, I supply a number of detailed figures so you can easily follow along, and I provide a step-by-step process that you can carry out in Photoshop. (And don't worry if you find the commands a bit intimidating. You can refer back to these figures as you advance through the chapters.) In addition, each exercise begins with how it's done in Photoshop and in the next chapters with Adobe Illustrator. The programming language for both programs is similar, so the process should be easy to follow. Read through this book carefully and you'll find that you quickly become comfortable with the different tools and the way to create different types of images — from portraits to computer wallpaper. If you want an in-depth look at Photoshop, I highly recommend downloading *_Photoshop CS6 All-In-One For Dummies_* (Wiley) and having a look at it. It covers most of the topics found in this book and presents them in a much easier-to-understand manner. Be sure to check out my website (www.lindyleevers.com) for my books, free videos, and upcoming classes and seminars. What You Can Do in Photoshop In this section, I offer a basic overview of the program, starting with the new features and finished products you can create using it. Some of the features are brand new in Photoshop CS

The tools in this section enable you to add, move, and delete layers. Layer You can rename or hide each layer by clicking on the eye icon, hovering over the layer's icon, and selecting one of the three options: Hiding the image layer removes it from the image. Re-adding the hidden layer allows the image to have the visible effects of the underlying layer. Cropping the

layer while it is hidden does nothing. It cannot be cropped. Re-adding the cropped layer is the only way to get the cropped image back. You can add or remove layers as you create a project, so you can preview the effect of each change before you commit it.

You cannot use the same image layer in two projects in the same document. You can use separate image layers in different projects. Photoshop Elements allows you to add layers, then merge a layer from another project, or even create a new layer in an existing image. You can position, resize, and move each layer within the image. Make a new layer After placing your image file onto a canvas, you can create a new layer and move it anywhere by clicking the New Layer icon at the bottom of the Layers palette. You can also make a new layer by dragging from the Layers palette. Then make sure that the New Layer button is visible, and click it to select the New Layer icon. Q: How to differentiate between List of List> in the whole application I am having a structure which is a generic List of a generic List of Person. eg. List> We are using it to do the following things 1: Do some processing on the data. 2: Iterate over the List>. For Number 1: We did this using Iterable. for (Person person : persons) { process(person) } Now we want to do the processing only for the List which is in the List> using the Iterable class. Any help appreciated. A: You can use collection.stream(), like this List persons =...; List> res = persons.stream().filter(p -> p instanceof List).map(List::of).collect(Collectors.toList()); //do the processing here or you can, if you have the original List> and just want to iterate over the list with a for loop, you can use List list =...; for (List res : list) { //process elements } Entry: MANDATORY ENTRY.
