The effect of glucose (1-10 mg/ml) on the structure of sperm flagella was studied. It was found that intracellularly, glucose caused an increase in the area of the mitochondria and endoplasmatic reticulum. An increase in the area of the sperm chromatin was observed as well. In all the cells the areas of the flagellar tubuli and axonemes were unchanged. The increase in the area of the mitochondria and endoplasmatic reticulum was accompanied by a decrease in the total volume of the cell. As to the motility of spermatozoa, there was an increase in the percentage of the cells with motile flagella after the addition of 5 and 10 mg/ml glucose. The structure of the flagella became normal in some cells after incubation with glucose (5 and 10 mg/ml). The results obtained indicate that glucose may act on the mechanism

KEYMACRO is a unique Macintosh-based layout editor and toolset developed by Teradyne. The system is designed for the automatic layout of high-density, fine-line, hybrid, or semi-custom ASICs. It can also be used to automatically create masks for applications such as laser trimming, laser inspection and optical inspection. The system can be used for manufacturing applications such as optical inspection or customer-specific photolithographic mask creation. The system provides the user with a comprehensive set of data flow-based schematic editing tools, an integrated circuit layout editor, a constraint-based scheduling algorithm, and support for a multitude of standard and customer-specific layout formats. Other features include an automatic pattern generator, manual layout entry, a pre-defined list of layout-related functions, and a simulation module for working with the circuits prior to layout. The system's layout editor has been completely rewritten to incorporate many of the best features of other commercially available layout editors. This allows the user to work more efficiently, resulting in the creation of more high-quality layouts. The editor allows the user to easily work with a large number of technology libraries and libraries of custom technology cells. It includes a powerful constraint system, which allows the user to easily constrain parts of the layout based on design, layout, timing, and other constraints. The system also provides a powerful schematic editor, which allows the user to build and manage high-level design architectures, including hierarchical and library-based approaches. The new schematic editor can also provide support for a wide range of standard and custom-designed cells. A powerful simulation module is included with the system, which allows the user to view the behavior of their circuit and circuits that have been designed in a similar manner to the one they are working on. The standard library support in the system provides the user with a convenient way of constructing their own library of cells. The system's support for EDIF (Electronic Design Interchange Format) support allows the user to easily incorporate customer-specific cell libraries into their designs. You can use the standard library to automatically populate your circuit board with specific electronic components such as MOSFETs, transistors, capacitors, inductors, and resistors. You can also incorporate user-defined custom components. You can use the configuration editor to change the standard cell parameters for any cell you have loaded into your design. These parameters include W/L dimensions, output impedance, supply voltage, and power consumption. The configuration editor also supports multiple device layouts

Electric is a fully-integrated EDA system with an integrated schematic editor, schematic compiler, and hardware-description language. As of this writing, Electric is in its second release. The first release was available in April 1995. It has been widely used as a design platform since. Electric can be considered a dedicated schematic editor, as it can be used to create schematic diagrams by hand. Its text-editor functions are available for text-level editing. Another key feature is its schematic compiler, which can automatically convert the schematic diagram into an HDL (Hardware Description Language) netlist. This can be used to synthesize and analyze the chip circuitry. In addition, there is a software-level simulation function in Electric, so the software level can be verified. Electric also has a built-in custom design language, called Electric Lang, which is a variant of Hardware Description Language. Electric for IC Design: Electric is a tool for electronic design automation (EDA). It can generate a netlist from a circuit schematic. This netlist can be used to analyze the design and to simulate the operation of the design. This chapter describes the software features of the main function of Electric. The software is free for a trial period. Electric has many powerful functions. Let's briefly discuss them. 1. Schematic Editor 2. Schematic Compiler 3. HDL Netlist Compiler 4. Netlist Simulator 5. Generate Circuit Models 6. Custom Design Language 7. Customizable Help System 8. Design Capabilities 9. Design Flexibility 10. Designer User Interface 11. Simpler Design 12. Tasks Electric is an integrated circuit design and development tool. It is a powerful system with a great user interface. Electric has an integrated schematic editor that enables users to generate netlists from the schematic. It has a schematic compiler that can convert a schematic into a HDL netlist. It has a netlist simulator that can be used to simulate the operation of the schematic. Electric also has a custom design language that can be used to describe the circuitry. Electric is a powerful and complete tool that offers great flexibility and power. Electric is an integrated circuit design tool with a great user interface. Electric is a comprehensive tool. Let's see the features of Electric. 1. Schematic Editor 2. Schematic Compiler 3. HDL Netlist Compiler 4. Netlist Simulator 5. Generate Circuit Models 6. Custom Design Language

What's New in the Electric?

____2) Writing the Hardware In this chapter, we will implement a small electric board. The board is controlled by a 2-input Flip Flop, which will make two outputs in the Out1 and Out2 ports. We will then connect a LED on the Out1 port to the +5V supply and a resistor to the Ground and VCC supply. The Out2 port will be connected

System Requirements For Electric:

OS: Windows 10/8/7/Vista/XP Processor: Intel Core 2 Duo 2.8 GHz / AMD Phenom X4 945 GHz or better Memory: 2 GB RAM Hard Disk: 500 MB free hard disk space DirectX: Version 9.0 or higher Video: NVIDIA GeForce GT 200 or ATI Radeon HD 2900 or better Network: Broadband Internet connection Sound Card: DirectX 9 compatible sound card Additional Notes: If you are using the
